Figure 1 is a 3D bar chart illustrating the distribution of cases across different age groups and sexes. The x-axis represents age groups from 0-4 to 95-99. The y-axis represents sex (Male, Female). The z-axis represents the number of cases, ranging from 0 to 100. The chart shows a high concentration of cases in the 0-4 age group for both sexes, with a significant peak for males in the 0-4 group (around 95 cases) and a slightly lower peak for females (around 85 cases). The number of cases generally decreases as age increases, with a notable increase in the 60-64 age group for both sexes.

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was significantly higher than the number of incorrect responses in all cases. The number of correct responses was significantly higher than the number of incorrect responses in all cases. The number of correct responses was significantly higher than the number of incorrect responses in all cases.

Figure 1 is a 3D bar chart illustrating the distribution of the number of children per family (Y-axis, 0 to 10) across different age groups (X-axis: 18-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75-84, 85-94) and sex (Z-axis: Male, Female). The chart shows that the number of children generally decreases as the age of the parent increases, with a notable peak for families with 2 children in the 25-34 age group. The distribution is also skewed towards a higher number of children for younger parents.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains.

[illegible]

Figure 1 consists of four histograms arranged in a 2x2 grid. The top row shows the distribution of non-zero elements for matrices A and B. The bottom row shows the distribution for matrices A+B and A-B. All histograms have an x-axis labeled 'Number of non-zero elements' ranging from 0 to 100 and a y-axis labeled 'Frequency' ranging from 0 to 10. The distributions for A and B are centered around 20-30, while the distributions for A+B and A-B are centered around 40-50.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains.

Figure 1 is a line graph showing the percentage of total sample for each age group across different years. The y-axis represents the percentage of total sample, ranging from 0 to 100. The x-axis represents the years, with labels for 1980, 1990, 2000, 2010, and 2020. The age groups are represented by different line styles: 0-14 (solid line), 15-24 (dashed line), 25-34 (dotted line), 35-44 (dash-dot line), 45-54 (long dashed line), 55-64 (short dashed line), 65-74 (solid line with circles), and 75+ (solid line with triangles). The graph shows a general trend of decreasing percentages for younger age groups and increasing percentages for older age groups over time.
